1 About this document

These operating instructions describe the [Vacuum Pump V-300] at the time supplied. They are an integral part of the product and contain important information that is necessary for safe operation and maintenance. These operating instructions apply to all variants of the [Vacuum Pump V-300] and are intended primarily for laboratory staff.

- To ensure safe and trouble-free operation, read these operating instructions before starting up the device and follow the guidance they contain.
- Keep the operating instructions somewhere near to the device.
- Pass on the operating instructions to any subsequent owner or user.

BÜCHI Labortechnik AG accepts no liability whatsoever for any faults or damage that result from the failure to follow these operating instructions.

- If you still have any questions after reading these operating instructions, please contact BÜCHI Labortechnik AG Customer Service. Contact details for your local agents can be found on the back cover of these operating instructions or on the Internet at http://www.buchi.com.

1.1 Connected devices

In addition to these operating instructions, you should also follow the instructions and specifications in the documentation for the connected devices.

1.2 Warning notices in this document

Warning notices warn you of dangers that can occur when handling the device. There are four danger levels, each identifiable by the signal word used.

<table>
<thead>
<tr>
<th>Signal word</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DANGER</td>
<td>Indicates a danger with a high level of risk which could result in death or serious injury if not prevented.</td>
</tr>
<tr>
<td>WARNING</td>
<td>Indicates a danger with a medium level of risk which could result in death or serious injury if not prevented.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Indicates a danger with a low level of risk which could result in minor or medium-severity injury if not prevented.</td>
</tr>
<tr>
<td>NOTICE</td>
<td>Indicates a danger that could result in damage to property.</td>
</tr>
</tbody>
</table>

1.3 Symbols

1.3.3 Other symbols

- **NOTE**
  This symbol draws attention to useful and important information.

- ✓ This character draws attention to a requirement that must be met before the instructions below are carried out.
- ▶ This character indicates an instruction that must be carried out by the user.
- ⇨ This character indicates the result of a correctly carried out instruction.

1.4 Available languages

These operating instructions were originally produced in German and have been translated into several other languages. The translations are available on the enclosed CD or can be obtained as a PDF file via [http://www.buchi.com](http://www.buchi.com).

1.5 Trademarks

Product names and registered or unregistered trademarks that are used in this instruction manual are used only for identification and remain the property of the owner in each case. For example, Rotavapor® is a registered trademark of BÜCHI Labortechnik AG.
2 Safety

2.1 Intended use
The [Vacuum Pump V-300] has been designed and built as an item of laboratory equipment. Its intended use is the evacuation of laboratory apparatus. This is done by means of a PTFE-diaphragm pump – with or without regulation by a vacuum controller.

PTFE-diaphragm pumps are used primarily for the following applications:
- Evacuating distillation apparatus, in particular rotary evaporators (Rotavapor®)
- Vacuum filtration
- Vacuum-drying cabinets
- Drying kilns

2.2 Use other than that intended
Use of any kind other than that referred to and any application that does not comply with the technical specifications constitutes use other than that intended. The operator alone is liable for any damage brought about by use of the device in a manner other than that intended.

The following uses are expressly forbidden:
- Use in areas which require explosion-safe apparatus.
- Pumping of liquids and solid particles.
- Processing samples which could be caused to explode or ignite by impact, friction, heat or sparks (e.g. explosives).
- Use for analysis (e.g. Kjeldahl).
- Drawing in fluids with an intake pressure higher than atmospheric pressure.
- Operation at ambient temperatures >40 °C.
- In ATEX II 3G T3 IIC X mode, drawing in fluids with a temperature > 40°C.
- In ATEX II 3G T3 IIC X mode, use of fluids with a flashpoint < 200°C.

2.3 Staff qualification
Unqualified persons are unable to identify risks and are therefore exposed to greater dangers.

The device may only be operated by suitably qualified laboratory staff.

These operating instructions are aimed at the following target groups:

Users
Users are persons that meet the following criteria:
- They have been instructed in the use of the device.
- They are familiar with the contents of these operating instructions and the applicable safety regulations and apply them.
- They are able on the basis of their training or professional experience to assess the risks associated with the use of the device.
Operator
The operator (generally the laboratory manager) is responsible for the following aspects:

- The device must be correctly installed, commissioned, operated and serviced.
- Only suitably qualified staff may be assigned the task of performing the operations described in these operating instructions.
- The staff must comply with the local applicable requirements and regulations for safe and hazard-conscious working practices.
- Safety-related incidents that occur while using the device should be reported to the manufacturer (quality@buchi.com).

BUCHI service technicians
Service technicians authorized by BUCHI have attended special training courses and are authorized by BÜCHI Labortechnik AG to carry out special servicing and repair measures.

2.4 Residual risks
The device has been developed and manufactured using the latest technological advances. Nevertheless, risks to persons, property or the environment can arise if the device is used incorrectly. Appropriate warnings in this manual serve to alert the user to these residual dangers.

2.4.1 Dangerous vapors
Distillation can produce dangerous vapors that are capable of causing life-threatening toxic effects.
- Do not inhale any vapors produced during distillation.
- Ensure that vapors are removed by a suitable fume hood.
- Only use the device in well ventilated areas.
- If vapors escape from joints or connections, check the seals concerned and replace them if necessary.
- Do not distill any unknown fluids.
- Observe the safety data sheets for all fluids used.

2.4.2 Faults during operation
If a device is damaged, sharp edges or exposed electrical wires can cause injuries.
- Regularly check device for visible damage.
- If faults occur, switch off the device immediately, unplug the power cord and inform the operator.
- Do not continue to use devices that are damaged.

2.4.3 Hot surfaces
The surfaces of the device can become very hot. If touched they can cause skin burns.
- Do not touch hot surfaces or else wear suitable protective gloves.
2.5 **Personal protective equipment**

Depending on the application, hazards due to heat and/or corrosive chemicals may arise.

- Always wear appropriate personal protective equipment such as safety goggles, protective clothing and gloves.
- Make sure that the personal protective equipment meets the requirements of the safety data sheets for all chemicals used.

2.6 **Modifications**

Unauthorized modifications may impair safety and lead to accidents.

- Use only genuine BUCHI accessories, spare parts and consumables.
- Technical modifications to the device or accessories should only be carried out with the prior written approval of BÜCHI Labortechnik AG and only by authorized BUCHI technicians.

BUCHI accepts no liability whatsoever for damage arising as a result of unauthorized modifications.
3 Product description

3.1 Description of function
The Vacuum Pump V-300 is intended for evacuating laboratory apparatus to a terminal vacuum of 5 mbar (± 2 mbar). It can be operated either as a standalone device or combined with optional accessories (see Specifications supplied). Once switched on, the Vacuum Pump V-300 runs in continuous mode unless it is connected to the Interface I-300/I-300 Pro unit. In unregulated continuous mode, the pump runs at a maximum speed of 1500 rpm and generates a terminal vacuum of 5 mbar (± 2 mbar). The time required for evacuation depends on the size (volume) of the vessel.

When operating as a standalone unit, the Vacuum Pump V-300 automatically switches to energy saving mode after 1 hour of operation. In energy saving mode, the Vacuum Pump V-300 runs at 80 % of maximum speed but still generates the same terminal vacuum of 5 mbar (± 2 mbar). After 2 hours of operation, the speed reduces to 50% of maximum while still maintaining the same terminal vacuum.

3.2 ATEX II 3G T3 IIC X rating
The vacuum pump has an ATEX II 3G T3 IIC X rating according to the ATEX Directive of the European Union. The rating applies exclusively to the area of the unit in contact with the fluid inside the vacuum pump. The vacuum pump is not suitable for operation in an environment with a potentially explosive atmosphere. According to the ATEX II 3G T3 IIC X rating, the vacuum pump is suitable for pumping explosive fluids.

The meaning of the classification code:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning according to Directive 2014/34/EU</th>
</tr>
</thead>
<tbody>
<tr>
<td>II</td>
<td>Equipment in this category is intended for use in areas that can be exposed to potentially explosive atmospheres.</td>
</tr>
<tr>
<td>3G</td>
<td>Equipment in this category is intended for use in areas in which it is unlikely that an explosive atmosphere will be created by gases, vapors, mist or swirling dust, but if such an atmosphere does nevertheless occur, then in all probability it will happen only rarely and for a short period of time.</td>
</tr>
<tr>
<td>IIC</td>
<td>Equipment in this category is suitable for processing fluids in the explosive class IIC.</td>
</tr>
<tr>
<td>T3</td>
<td>Equipment in this category is suitable for processing fluids with a flashpoint &gt; 200°C.</td>
</tr>
<tr>
<td>Code</td>
<td>Meaning according to Directive 2014/34/EU</td>
</tr>
<tr>
<td>------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>X</td>
<td>Equipment in this category is subject to special requirements to satisfy the classification specified. Requirements for satisfying the classification:</td>
</tr>
<tr>
<td></td>
<td>• See Chapter 3.5 &quot;Technical data&quot;, page 19</td>
</tr>
<tr>
<td></td>

8. Power supply connection
3.3.3 Connections

Fig. 3: Connections on the V-300

1  Connection for alternative pump controller (CTRL)
2  Fill level sensor connection (LEVEL)
3  Standard BUCHI communication ports (COM)

Standard BUCHI communication port (COM)
The standard BUCHI communication port is used to connect the Interface I-300/I-300 Pro to the Vacuum Pump V-300. For more information, see Chapter 5.13.1 "Overview: Setting up communication connections (COM)", page 38.

Connection for alternative pump controllers (CTRL)
The CTRL socket offers the following options:

- Digital ON/OFF control of the pump via legacy devices (V-850 / V-855, V-800 / V-805) or via the VacuBox.
- Operation of two Rotavapor systems with only one Vacuum Pump V-300, see Operating the Vacuum Pump V-300 with 2 Rotavapor systems.
- Control of pump speed by different-make products with analog 0–10 V signal.

**Connection for fill level sensor (LEVEL)**

A fill-level sensor can be connected to the Vacuum Pump V-300 as an option. The fill-level sensor measures the fill level of the receiving flask if a secondary condenser or a secondary cold trap is connected to the V-300. If the relevant level is exceeded in the receiving flask, a message appears on the display of the Interface I-300/I-300 Pro.
3.3.4 Internal view

4 Transport and storage

4.1 Transport

**NOTICE**

Risk of breakage due to incorrect transportation

- Make sure that all parts of the device are safely packed in such a way as to prevent breakage, ideally in the original box.
- Avoid sharp movements during transit.

- After transportation, check the device for damage.
- Damage that has occurred in transit should be reported to the carrier.
- Keep packing for future transportation.

4.2 Storage

- Make sure that the ambient conditions are complied with (see Chapter 3.5 "Technical data", page 19).
- Wherever possible, store the device in its original packaging.
- After storage, check the device, all glass components, seals and tubing for damage and replace if necessary.
5 Installation

5.1 Important considerations prior to commissioning

⚠️ WARNING

Risk of irritation of mucous membranes and poisoning from inhalation of hazardous gases and vapors.

In the process of evacuation it is possible that hazardous substances may be pumped out at the same time and released into the atmosphere. In addition, it is possible for such substances to collect as condensation at leaking connections.

▶ Operate the pump inside a fume hood.
▶ Direct vapors from the pump outlet into the fume hood.
▶ If necessary, wear a face mask and safety goggles.
▶ If necessary, only handle pump and accessories with protective gloves.

⚠️ WARNING

Risk of fire or explosion from flammable solvent vapors.

In the process of evacuation, it is possible for solvent vapors to get into the area of the pump that does not meet the ATEX II 3G T3 IIC X rating requirements.

▶ Clean the vacuum pump according to the instructions.
▶ Connect a Woulff bottle upstream of the pump intake.
▶ Operate the pump inside a fume hood.

⚠️ CAUTION

Health risks when handling corrosive substances.

▶ When working with strong acids or caustic solutions, always wear personal protective equipment (safety goggles, protective clothing, protective gloves).
5.2 Installation site

**NOTICE**

Risk of property damage from falling equipment (e.g. in an earthquake)

- Secure the [Vacuum Pump] against falling by means of the lashing eye on the rear of the device, see Chapter 3.3.2 "Rear view", page 13.

The installation site must meet the following requirements:

- Firm and level surface: at least 200 mm x 300 mm (W x D)
- Height: at least 300 mm
- Set up inside a fume hood or feed the pump outlet into the fume hood
- Sufficient clearance on all sides of the device (approx. 10 cm) in order to ensure air circulation
- Clear air outlet at the rear (ventilation slots must be kept clear)

The [V-300] is intended for use in laboratory environments. See Chapter 3.5.2 "Ambient conditions", page 19.
5.3 **Securing against earthquakes**

The Vacuum Pump V-300 has an earthquake fixing to protect the device against falling.

![Diagram of lashing eye](image)

**Fig. 8: Lashing eye for securing against falling during earthquakes**

1  Lashing eye

- Thread a strong cord or a wire through the lashing eye (1).
- Tie the strong cord or a wire to a fixed point.
5.4 Connecting laboratory equipment

Fig. 9: Connections for laboratory equipment on the V-300

1  Pump outlet  2  Pump intake (vacuum)

The laboratory apparatus to be evacuated is connected to the optional Woulff bottle. The Woulff bottle is connected to the pump intake (2) of the V-300 using a GL14 connection.

- Connect a Woulff bottle upstream of the pump intake (see Chapter 5.6 "Connecting a Woulff bottle", page 28).
- Connect the tubing to the Woulff bottle inlet using a GL14 cap nut and tube seal.
- Connect the laboratory equipment to be evacuated to the tube connected to the Woulff bottle inlet.

For details of connecting the [V-300] to other laboratory equipment, see Chapter 5.13.3 "Overview: setting up vacuum tubing connections", page 40.
5.5 Connecting the silencer

The silencer can be connected directly to the V-300 or to the outlet of a secondary condenser.

5.5.1 Connecting silencer directly to V-300

Fig. 10: Silencer on pump outlet of V-300

1 GL14 cap nut on silencer inlet
2 Silencer
3 Silencer outlet

Fit the silencer (2) on the pump outlet.
Slide the GL14 cap nut forward on the silencer inlet (1) and screw it onto the GL14 thread of the pump outlet.

NOTE

A tube can be connected to the silencer outlet (3) to direct the exhaust air into a fume hood.
5.5.2 Connecting the silencer to the outlet of the secondary condenser

Fig. 11: Silencer on outlet of secondary condenser

1 Secondary condenser
2 GL14 cap nut
3 Silencer

Precondition:
- A secondary condenser (1) is mounted on the pump outlet of the V-300 and connected up, see Connecting a secondary condenser.
- Fit the silencer (3) on the secondary condenser outlet.
- Slide the GL14 cap nut forward and tube seal on the silencer inlet (2) and screw it onto the GL14 thread of the secondary condenser outlet.
5.6 Connecting a Woulff bottle

Fig. 12: Woulff bottle on pump inlet of V-300

<p>| | |</p>
<table>

</tr>
<tr>
<td>4</td>
<td>Woulff bottle glass component</td>
</tr>
</tbody>
</table>

The Woulff bottle is fixed to a mounting rail on the V-300 and is connected to the pump intake.

► Fit the holder (8) around the neck of the Woulff bottle.
► Fit a short section of vacuum tubing (2) to the outlet of the Woulff bottle (3).
► Slide a GL14 cap nut with tube seal over the unattached end of the vacuum tube.
► Position the Woulff bottle in front of the pump inlet (1) of the V-300. Slide the holder into the lower slot of the mounting rail (6). When doing so, make sure that the outlet of the Woulff bottle with connecting tube attached is facing the pump inlet.
► Insert connecting tube (2) in the pump inlet (1) and screw GL14 cap nut onto the thread of the pump inlet.
5.6.1 Connecting the VacuBox via a Woulff bottle

If the vacuum pump is to be controlled via an Interface I-300, the Woulff bottle must be connected to the VacuBox by a connecting tube.

Precondition:
- The Woulff bottle is mounted on and connected to the vacuum pump.
- VacuBox (2) is mounted on the vacuum pump, see Chapter 5.10 "Fitting a VacuBox", page 33.
- VacuBox (2) is mounted on the vacuum pump, see Chapter 5.10 "Fitting a VacuBox", page 33.

- Fit a connecting tube to the outlet of the Woulff bottle (3) and the vacuum connection of the VacuBox (1).
- If necessary, fit a connecting tube to the inlet of the Woulff bottle (4) and the vacuum connection of the cooling condenser (5).

Fig. 13: Woulff bottle tubing connections

1  Vacuum connection on VacuBox 4  Woulff bottle inlet
2  VacuBox 5  Vacuum connection on cooling condenser
3  Outlet for VacuBox connection
CONNECT THE COMMUNICATION CABLE, SEE CHAPTER 5.12 "CONNECTING COMMUNICATION CABLES TO THE V-300", PAGE 36.

NOTE

In a BUCHI distillation system, the VacuBox and Woulff bottle can alternatively be mounted on the Rotavapor® instead of on the vacuum pump. What is important is that the VacuBox and Woulff bottle are as close as possible to each other (on the same device) as otherwise there is a vacuum control lag. If the VacuBox and Woulff bottle are mounted on and connected to the Rotavapor®, the relevant sections of the operating instructions for the Rotavapor® R-300 must be followed.
### 5.7 Connecting a secondary condenser

![Diagram of secondary condenser connection]

The secondary condenser is fixed to a mounting rail on the vacuum pump (9) and is connected to the pump outlet (2).

- Fit a short connecting tube (3) to the secondary condenser inlet (4).
- Loosely screw a GL14 union nut together with tube seal onto the thread of the pump outlet (2), Chapter 7.2.8 "Fitting GL14 cap nut with tube seal", page 59. **NOTICE! If incorrectly fitted, the tube seals may be damaged.**
- Position the secondary condenser in front of the pump outlet of the vacuum pump. Slide the holder into the upper slot of the mounting rail (7). When doing so, make sure that the inlet of the secondary condenser with connecting tube attached is facing the pump outlet.
- Insert the connecting tube into the threaded pump outlet connector, taking care not to damage the tube seal when doing so.
- Tighten the GL14 union nut.
- Fit receiving flask (11) onto the bottom outlet of the secondary condenser and fix with the aid of a catchpot clip (10).
- Option: From the outlet of the secondary condenser (6), feed another connecting tube directly into a fume hood.
5.8 Connecting a secondary cold trap

The secondary cold trap is fixed to a mounting rail on the vacuum pump in the same way as the secondary condenser (see Connecting a secondary condenser) and is connected to the pump outlet.

▶ Fit a short connecting tube (3) to the secondary cold trap inlet (4).
▶ Loosely screw a GL14 union nut together with tube seal onto the thread of the pump outlet (2), Chapter 7.2.8 "Fitting GL14 cap nut with tube seal", page 59.

**NOTICE! If incorrectly fitted, the tube seals may be damaged.**

▶ Position the secondary cold trap in front of the pump outlet of the vacuum pump. Slide the holder into the upper slot of the mounting rail (7). When doing so, make sure that the inlet of the secondary cold trap with connecting tube attached is facing the pump outlet.
▶ Insert the connecting tube into the threaded pump outlet connector, taking care not to damage the tube seal when doing so.
▶ Tighten the GL14 union nut.
▶ Fit receiving flask (9) onto the bottom outlet of the secondary cold trap and fix with the aid of a catchpot clip (8).
▶ From the outlet (6) of the secondary cold trap, feed another connecting tube directly into a fume hood.

Fig. 15: Secondary cold trap and holder

1 Secondary cold trap

3 Connecting tube
4 Secondary cold trap inlet
5 Holder for secondary cold trap
6 Secondary cold trap outlet
7 Mounting rail on the vacuum pump
8 Catchpot clip
9 Receiving flask
5.9 **Fitting an Interface I-300**

Tools required:
- Torx key Tx25

The Interface I-300 can be mounted on the top of the Vacuum Pump V-300 using a holder.
- Remove the rubber plug (6) from the top panel of the vacuum pump. Use a screwdriver if necessary.
  - Underneath the rubber plug is a threaded hole for a screw.
- Position the holder (4) over the threaded hole (6) and fix it in place using the screw (2) supplied. When doing so, pass the screw through the hole in the metal plate (3).
- Feed the communication cable through the holder from the rear and connect it to the COM port on the back of the interface unit.
- Position the interface unit (1) on the holder and fix it in place using a knurled-head screw (5) inserted from the back.

5.10 **Fitting a VacuBox**

Fitting and connection of a VacuBox to the V-300 are necessary if the pump is to be controlled via an Interface I-300/I-300 Pro. For details, see Chapter 5.13 "Assembling the BUCHI distillation system", page 37.
Fig. 16: VacuBox on V-300

1  Fixing brackets  3  VacuBox
2  Screws

Tools required:
- Torx key Tx10

- Press fixing brackets (1) into the holes in the top and bottom of the VacuBox. The wider of the two fixing brackets has to be fitted at the bottom.
- Position the VacuBox (3) on the rear of the V-300 on the left inner face of the recess.
- Fix each fixing bracket to the casing of the V-300 with a screw (2).

**NOTE**
If a VacuBox is fitted, a Woulff bottle is a compulsory requirement.
5.11 Connecting the vacuum pump to the power supply

Fig. 17: Electrical connections on the V-300

1  Power supply connection

Plug the power cord into the power supply socket (1) on the pump and then into a mains power socket. Make sure that the available power supply matches the rating indicated on the type plate.
5.12 Connecting communication cables to the V-300

Fig. 18: Communication connections on V-300

1  Connection for alternative pump controller (CTRL)  3  Standard BUCHI communication ports (COM)
2  Fill level sensor connection (LEVEL)

► Plug the communication cable for connection to other BUCHI laboratory equipment into one of the two standard BUCHI communication ports (3).
► Plug the communication cable into the green communication port on the other item of laboratory equipment. For details of connecting the equipment via the communication ports see Chapter 5.13.1 "Overview: Setting up communication connections (COM)", page 38.
5.13  Assembling the BUCHI distillation system

In order to use the [Vacuum Pump] to best effect, we recommend that it is used together with the following equipment:

The F-3xx is a recirculating chiller with a sealed circulation system. It is available in various capacity ratings.

The Interface I-300/I-300 Pro together with the VacuBox can be used to control and monitor the vacuum. It can control the Rotavapor, the Vacuum Pump V-300/V-600 and the Recirculating Chiller F-3xx.

The Vacuum Pump V-300/V-600 is a diaphragm pump designed for evacuating laboratory apparatus. It can be operated either as a standalone device or combined with optional accessories such as an interface unit and a secondary condenser to form a complete vacuum system. The laboratory equipment to be evacuated is connected to the vacuum pump and the VacuBox by means of vacuum tubing. See Chapter 5.13.3 "Overview: setting up vacuum tubing connections", page 40.

Data communication between the laboratory equipment takes place via the communication ports. See Chapter 5.13.1 "Overview: Setting up communication connections (COM)", page 38.

The coolant circulates around the distillation system through a separate circulation system. See Chapter 5.13.2 "Overview: setting up coolant tubing connections", page 39.
5.13.1 Overview: Setting up communication connections (COM)

The laboratory apparatus can be connected in any order. As well as the interface unit, a VacuBox also has to be connected. Below is an example of the connections between the laboratory apparatus.

---

Fig. 19: Schematic diagram of communication connections between the BUCHI laboratory equipment (example)
5.13.2 Overview: setting up coolant tubing connections

The tubing connections between the various items of BUCHI laboratory equipment form a sealed circulation system. The starting and finishing point is always the recirculating chiller (F-3xx).

Below is an example of the tubing connections between the laboratory apparatus.

![Diagram of tubing connections]

Fig. 20: Coolant tubing connections in a BUCHI distillation system (example)

1. Inlet on Recirculating Chiller F-3xx
2. Outlet on Recirculating Chiller F-3xx
3. Condenser inlet on Rotavapor R-300
4. Condenser outlet on Rotavapor R-300
5. Secondary condenser inlet on Vacuum Pump V-300/V-600
6. Secondary condenser outlet on Vacuum Pump V-300/V-600

- Connect a tube between the outlet of the recirculating chiller (2) and the inlet of the condenser on the Rotavapor R-300 (3).
- Connect a tube between the outlet of the condenser on the Rotavapor R-300 (4) and the inlet of the secondary condenser on the Vacuum Pump V-300/V-600 (5).
- Connect a tube between the outlet of the secondary condenser on the Vacuum Pump V-300/V-600 (6) and the inlet of the recirculating chiller (1).

**NOTE**

Use GL14 hose barbs for the tubing connections.

Secure tubes with spring clips where necessary.
### 5.13.3 Overview: setting up vacuum tubing connections

The vacuum tubing connections in a typical BUCHI distillation system lead from the Rotavapor R-300 via a Woulff bottle to the Vacuum Pump V-300/V-600. The vacuum is measured by means of the VacuBox, which is also connected to the Woulff bottle.

![Vacuum tubing connections diagram](image)

**Fig. 21: Coolant tubing connections in a BUCHI distillation system**

1. Secondary condenser outlet
2. Vacuum Pump V-300/V-600 outlet
3. Vacuum Pump V-300/V-600 inlet
4. Woulff bottle outlet (PUMP)
5. Woulff bottle inlet (CONTR)
6. VacuBox vacuum connection

- Connect a tube between the Rotavapor R-300 and the top inlet of the Woulff bottle.
- Connect a tube between the outlet of the Woulff bottle marked PUMP (4) and the pump inlet (3).
- Connect the secondary condenser to the pump outlet (2).
- For measuring and controlling the vacuum, connect a tube between the inlet of the Woulff bottle marked CONTR (5) and the VacuBox (6).

The pressure is measured in the VacuBox. The current working pressure can be indicated and controlled by means of the Interface I-300/I-300 Pro.

**NOTE**

The VacuBox and Woulff bottle can be mounted either on the Rotavapor R-300 or the Vacuum Pump V-300/V-600. What is important is that the VacuBox and Woulff bottle are as close as possible to each other (on the same device) as otherwise there is a vacuum control lag.
5.14 **Operating the vacuum pump with 2 Rotavapor systems**

It is possible to simultaneously operate 2 Rotavapor® systems with only one vacuum pump. This involves using the alternative pump control connection (CTRL) on the vacuum pump, see Chapter 3.3.3 "Connections", page 14.

**NOTE**
The pump speed is then no longer controlled.

The following equipment and accessories are required:

- 2x Rotavapor®
- 2x Interface I-300/I-300 Pro
- 2x Valve unit
- 2x VacuBox
- 1x Y-cable
- 2x Standard BUCHI communication cable
- 1x Vacuum Pump V-300
- If an R-300 is not used: 2x mains adaptor and lead
Fig. 22: Schematic diagram of connections when using 2 Rotavapor® systems

1. Standard BUCHI communication ports (COM)
2. Connection for valve unit (VALVE)
3. Option: Mains adaptor and lead
4. Connection for Y cable on VacuBox (CW)
5. Y cable (8-pin MiniDIN CTRL)
6. Connection for alternative pump controller (CTRL) on the vacuum pump

- Connect up each set of 1 Rotavapor R-300, 1 Interface I-300/I-300 Pro and 1 VacuBox via the standard BUCHI communication ports (1).
- Connect vacuum tubing from each valve unit to one Rotavapor R-300 and one VacuBox. To do so, use the CONTR inlets (B) for the Woulff bottle.
- Connect each valve unit to one VacuBox using the connection marked VALVE (2).
- Connect a tube between the two valve units. To do so, use the outlets (PUMP) for the Woulff bottle.
- Plug a Y cable (5) into the CW connections (4) of the two VacuBoxes and connect it to the vacuum pump using the CTRL connection (5).
- Connect a tube between one valve unit and the vacuum pump. Use the connection marked PUMP on the valve unit for this purpose.
If a Rotavapor R-300 is not used, connect each VacuBox to the external power supply by means of a mains adaptor (3).
6 Operation

⚠️ CAUTION
Risk of implosion of damaged glass components
Risk of injury from glass splinters and escaping fluids
▶ Always inspect all glass components for damage every time they are to be used.

⚠️ CAUTION
Risk of explosion caused by residues of previously used fluids in the vacuum system.
▶ Always clean the vacuum pump according to the instructions before any change of fluid.

⚠️ CAUTION
Potential danger of inactive cooling during distillation
Risk of burns if solvent vapors are ignited
▶ Always monitor the function of the cooling system.

6.1 Operating V-300 without Interface I-300/I-300 Pro
If not controlled by an Interface I-300/I-300 Pro, the Vacuum Pump V-300 runs in continuous mode and switches to energy saving mode after one hour, see Chapter 3.1 "Description of function", page 11.
▶ To start the pump, switch on the master switch on the front of the V-300.

6.2 Operating V-300 with Interface I-300/I-300 Pro
The Vacuum Pump V-300 can also be externally controlled by an Interface I-300/I-300 Pro. Control encompasses the following parameters and functions:
- Setting the required vacuum
- Timer

More information on overall control of distillation processes comprising the V-300 and other laboratory equipment can be found in the operating instructions for the Interface I-300/I-300 Pro.
7 Cleaning and servicing

NOTE
Users may only carry out the servicing and cleaning operations described in this section.

Any servicing and repair work which involves opening up more than the casing front may only be carried out by authorized service technicians.

- Use only genuine BUCHI consumables and spare parts in order to ensure correct operation of the device and preserve the warranty.
- Before carrying out any servicing work, switch off the device and disconnect it from the power cable.

7.1 Cleaning

7.1.1 Important considerations when cleaning

⚠️ WARNING
Risk of fatal injury from electric shock.
If the pump is opened up while it is running there is a risk of dangerous electric shocks.

- Before carrying out any cleaning or servicing work, always shut down the device and disconnect the power cable.

⚠️ WARNING
Creation of sparks by foreign particles in the vacuum system.
The instrument is not suitable for operation according to ATEX II 3G T3 IIC X.

- Make sure that no foreign particles get into the vacuum system during cleaning and maintenance work.

⚠️ WARNING
Risk of flammable atmosphere if vacuum system is not sealed.
The instrument is not suitable for operation according to ATEX II 3G T3 IIC X.

- Make sure that the vacuum system is sealed after cleaning and maintenance work.

7.1.2 Cleaning the pump
The pump only needs to be cleaned if the terminal vacuum is no longer achieved, dirt is visible through the inspection window or after using certain chemicals. Daily cleaning of the pump is not necessary.

- Detach tubing connections to other laboratory equipment.
If present, remove Woulff bottle from pump intake and secondary condenser or cold trap from pump outlet and clean them.

Hold several paper towels in front of the pump outlet.

Switch on the Vacuum Pump V-300 and allow it to run.

Spray 5 to 10 mL of acetone or ethanol into the pump intake.

Hold your finger over the pump intake for a short time so that a vacuum is created.

Remove your finger from the pump intake again.

Allow the pump to run until there is no more liquid inside the pump heads.

If necessary, repeat the process of flushing with acetone/ethanol and evacuating.

Switch off the pump and reconnect the tubing.

**NOTE**

If the procedure described above is insufficient, carry out the following steps:

- Clean the casing, see Chapter 7.1.3 "Cleaning the casing", page 46.
- Clean the glass components, see Chapter 7.1.4 "Cleaning glass components", page 46.
- Clean the tubing, see Chapter 7.1.5 "Cleaning internal pump tubing", page 47.
- Clean the diaphragms, see Chapter 7.1.6 "Cleaning the diaphragm", page 47.

### 7.1.3 Cleaning the casing

**NOTICE**

**Risk of acid damage**

The casing of the unit is made of plastic. Acid may damage the material.

- Immediately remove any drops of acid with a damp cloth.

- Use a damp cloth to clean the device.
- To clean the casing, only use ethanol or soapy water.

### 7.1.4 Cleaning glass components

On the front of the V-300 there is an inspection window made of glass. That inspection window may mist over or become dirty from vapors.

- Remove the casing front, see Chapter 7.2.2 "Dismantling and reassembling pump head", page 49.
- Rinse inspection window in front cover with water and a conventional cleaning agent (e.g. mild soap and water solution).
- Wipe inspection window dry with a cloth.
- Refit front cover and screw in place.

The accessories (Woulff bottle, secondary cold trap, secondary condenser) consist mainly of glass and must always be inspected before and after use and cleaned as necessary.

As the glass components are under vacuum when in use, they are subjected to high stress.

- Secondary cold trap and secondary condenser: disconnect all tubing and remove from the vacuum pump.
Woulff bottle: unscrew the glass part from the holder.
Check the glass components for cracks, chips and other signs of damage.
Replace any damaged glass components.
Rinse out glass components with water and a conventional cleaning agent (e.g. mild soap and water solution).
Wherever possible, clean glass components by hand.

NOTE
Inserting a thin copper wire into the coil of the secondary condenser reduces algae growth.

7.1.5 Cleaning internal pump tubing
After evacuation, there may still be residual fluid from condensed vapors in the tubing inside the pump. The pump can largely dry itself out when running idle. See Chapter 7.1.2 "Cleaning the pump", page 45.
To clean the connecting tubing inside the pump between the two pump heads, it is necessary to open up the pump.

Precondition:
- Pump has been shut down.
- Remove the front casing and take out the pump-head connecting tube (see Chapter 7.2.5 "Replacing connecting tubes", page 55.
- Rinse out the pump-head connecting tube with acetone. If necessary, remove residues inside the tubing with a suitable implement.
- Refit the pump-head connecting tube (see Chapter 7.2.5 "Replacing connecting tubes", page 55).
- Refit the front casing.
- Switch on the pump and allow it to run in continuous mode until the inside of the tubing is dried out.

7.1.6 Cleaning the diaphragm
- Remove the diaphragm, see Chapter 7.2.3 "Replacing the diaphragm", page 52.
- Clean the diaphragm with a cloth and a little acetone.

7.2 Servicing

7.2.1 Notes on servicing

WARNING

Risk of fatal injury from electric shock.
If the pump is opened up while it is running there is a risk of dangerous electric shocks.
- Before carrying out any cleaning or servicing work, always shut down the device and disconnect the power cable.
**NOTICE**

Risk of pump damage and loss of warranty entitlement.

Unauthorized opening up of any casing components apart from the front casing may permanently impair the function of the pump.

- Only allow authorized BUCHI service technicians to open up the rear part of the pump.

---

**WARNING**

Creation of sparks by foreign particles in the vacuum system.

The instrument is not suitable for operation according to ATEX II 3G T3 IIC X.

- Make sure that no foreign particles get into the vacuum system during cleaning and maintenance work.

---

**WARNING**

Risk of flammable atmosphere if vacuum system is not sealed.

The instrument is not suitable for operation according to ATEX II 3G T3 IIC X.

- Make sure that the vacuum system is sealed after cleaning and maintenance work.
7.2.2 Dismantling and reassembling pump head

The two pump heads and the pump-head connecting tubes are located behind the front casing (1).

Fig. 23: front casing of V-300

</tbody>
</table>

Tools required:
- Torx key Tx25

Precondition:
- Pump has been shut down.
- Connections between the pump and other laboratory equipment have been disconnected.

- Using a Torx key (3), unscrew the two fixing screws (5) at the sides.
- Remove front casing (1).
Step 1: removing connecting tubes

The V-300 has three pump-head connecting tubes as follows:
- Connecting tube (1) between upper pump head and pump intake connection
- Connecting tube (7) between the two pump heads
- Connecting tube (5) between lower pump head and pump outlet connection

Removing connecting tube between pump head and pump intake or outlet connection
Tools required:
- Torx key Tx10
  - Unscrew the fixing screws (3) for the elbow connector (2) on the pump head.
  - Unscrew and pull back the GL14 cap nut (4) on the connection for the pump intake or pump outlet.
  - Remove the connecting tube (1, 5) together with elbow connector.

Removing connecting tube between the two pump heads
Tools required:
- Torx key Tx10
  - Unscrew the fixing screws (3) from the two elbow connectors (2).
- Remove the two elbow connectors together with the connecting tube (7).

**Step 2: dismantling pump head**

![Diagram of pump head and diaphragm](image)

Fig. 25: Pump head and diaphragm of V-300

1. Pump head
2. Fixing ring
3. Torx-head screws

Tools required:
- Torx key Tx25

- Using a Torx key, unscrew the four Torx-head screws (3).
- Remove the fixing ring (2) and pump head (1).

⇒ Behind the pump head is the pump diaphragm. To replace the diaphragm, see Chapter 7.2.3 "Replacing the diaphragm", page 52.

**Step 3: Reassembling and refitting the pump head**

- Fit the pump head over the diaphragm.
- Position the fixing ring on the pump head and fix in place with four Torx-head screws.
- Refit the connecting tube between the two pump heads.
- Refit the connecting tube between pump head and pump intake or outlet connection.
- Refit casing front.
7.2.3 Replacing the diaphragm

Diaphragms must be replaced if they are defective or dirty and previous cleaning has not successfully remedied the problem.

Tools required:
- Diaphragm grips (see Spare parts).

Precondition:
- Pump has been shut down.

- Remove the front casing, see Chapter 7.2.2 "Dismantling and reassembling pump head", page 49.
- Remove the connecting tubes, see Chapter "Step 1: removing connecting tubes", page 50.
- Remove the fixing ring and pump head, see Chapter "Step 2: dismantling pump head", page 51.
- Grip diaphragm (1) with diaphragm grips and turn counter-clockwise.
- Remove old diaphragm, insert new diaphragm and tighten using the diaphragm grips.
- Tighten new diaphragm by turning clockwise with the diaphragm grips. When doing so, tighten the diaphragm until the diaphragm grips slip.
- Fit the pump head and fixing ring over the diaphragm and fix in place.
- Refit connecting tubes.
- Refit front casing.
7.2.4 Replacing the non-return valve

On each of the two pump heads of the V-300 there are two non-return valves with O-rings (see Chapter 7.2.6 "Replacing O-rings", page 57). They are inside the elbow connectors. To access the valves, the connecting tubes and elbow connectors first have to be removed from the pump heads.

- Remove the front casing, see Chapter 7.2.2 "Dismantling and reassembling pump head", page 49.
- Remove the elbow connectors together with connecting tubes, see Chapter "Step 1: removing connecting tubes", page 50.
- Remove the old non-return valves (2) and O-rings (1) from the elbow connectors. Use the diaphragm grips to do so., Chapter 7.2.7 "Removing non-return valve from elbow connector", page 58.
- Insert new non-return valves and O-rings in the elbow connectors. **NOTICE!** When inserting the valves, pay attention to the symbols on the pump heads! The two valves on each pump head are inserted the opposite way round from each other.
Refit the elbow connectors together with connecting tubes, see Chapter "Step 3: Reassembling and refitting the pump head", page 51.

Refit front casing.

**NOTE**

The diaphragm grips supplied have a notch in the front of the right-hand grip. This can be used as an aid to removing the non-return valves from the elbow connectors.
7.2.5 Replacing connecting tubes

The V-300 has a total of three connecting tubes on the pump heads, see Chapter "Step 1: removing connecting tubes", page 50.

Replacing pump-head connecting tube

![Diagram of pump-head connecting tube in V-300]

Fig. 31: Pump-head connecting tube in V-300

1. Fixing screws for elbow connector  
2. Elbow connector  
3. Pump-head connecting tube  
4. Tube seal  
5. GL14 union nut

Tools required:
- Torx key Tx10
- Remove the front casing, see Chapter 7.2.2 "Dismantling and reassembling pump head", page 49.
- Unscrew the fixing screws (1) from the two elbow connectors (2).
- Remove the two elbow connectors together with the connecting tube (3).
- Unscrew and pull back the GL14 union nut (5) on each end of the connecting tube.
- Pull the ends of the tubes out of the elbow connectors.
- Pull the GL14 union nuts off the connecting tube and dispose of the old connecting tube.
- Loosely fit two new union nuts with tube seals into the connectors, see Chapter 7.2.8 "Fitting GL14 cap nut with tube seal", page 59. **NOTICE! If incorrectly fitted, the tube seals may be damaged.**
- Insert new connecting tube into the elbow connectors, taking care not to damage the tube seals when doing so.
- Fit the elbow connectors onto the ports in the pump heads and screw in place.
- Tighten the two union nuts.
- Refit front casing.
Replacing connecting tube to pump intake or pump outlet

Fig. 32: Connecting tubes to the V-300 pump heads

1. Connecting tube
2. GL14 union nut
3. Fixing screws for elbow connector
4. Elbow connector

Tools required:
- Torx key Tx10
- Remove the front casing, see Chapter 7.2.2 "Dismantling and reassembling pump head", page 49.
- Unscrew the fixing screws (3) for the elbow connector on the pump head.
- Unscrew and pull back the GL14 union nut (2) on the connection for the pump intake or pump outlet.
- Remove the connecting tube (1) together with elbow connector.
- Unscrew and pull back the GL14 union nut on the elbow connector.
- Pull the end of the tube out of the elbow connector.
- Pull the GL14 union nuts off the connecting tube and dispose of the old connecting tube.
- Loosely fit two new union nuts with tube seals into the new connecting tube, see Chapter 7.2.8 "Fitting GL14 cap nut with tube seal", page 59. **NOTICE! If incorrectly fitted, the tube seals may be damaged.**
- Insert one end of the connecting tube (see figure) into the elbow connector, taking care not to damage the tube seal when doing so.
- Insert the other end of the connecting tube into the pump intake or pump inlet connection, taking care not to damage the tube seal when doing so.
- Fit the elbow connector onto the port in the pump head and screw in place.
- Tighten the GL14 union nuts on the connection for the pump intake/pump outlet.
- Refit front casing.
7.2.6 Replacing O-rings

The O-rings have to be replaced if the V-300 is no longer functioning at full capacity and no longer achieving the terminal vacuum. In such cases, it makes sense to replace all four O-rings in the elbow connectors on the pump heads (see Chapter 7.2.4 "Replacing the non-return valve", page 53).

Fig. 33: Connecting tubes, elbow connectors and O-rings inside V-300

1. O-ring
2. Fixing screws for elbow connector
3. Elbow connector

- Remove the front casing, see Chapter "Step 3: Reassembling and refitting the pump head", page 51.
- Remove the elbow connectors (3) together with the connecting tubes, see Chapter "Step 1: removing connecting tubes", page 50.
- Remove the old O-rings (1) together with the non-return valves from the elbow connectors. Use the diaphragm grips to do so., Chapter 7.2.7 "Removing non-return valve from elbow connector", page 58.
- Insert new O-rings together with non-return valves in the elbow connectors.

NOTICE! When inserting the valves, pay attention to the symbols on the pump heads! The two valves on each pump head are inserted the opposite way round from each other.
Refit the elbow connectors together with connecting tubes, see Chapter "Step 3: Reassembling and refitting the pump head", page 51.

Refit front casing.

### 7.2.7 Removing non-return valve from elbow connector

The diaphragm grips supplied have a notch in the front of the right-hand grip. This can be used as an aid to removing the non-return valves from the elbow connectors.

- Slide the connector (4) up to the top of the notch in the diaphragm grips.
- Press the connector upwards slightly so that the non-return valve twists in the notch and then tilt it down.

⇒ The non-return valve and O-ring come away from the connector.
7.2.8 Fitting GL14 cap nut with tube seal

![Diagram of fitting GL14 cap nut with tube seal](example). Fig. 36: Fitting GL14 cap nut with tube seal (example shows VacuBox)

1. Tube seal
2. GL14 cap nut
3. Tubing

- Insert the tube seal (1) in the GL14 cap nut (2) ensuring it is straight. **NOTICE! Risk of damaging tube seal.** Make sure that the tube seal does not twist or jam in the GL14 cap nut.
- Loosely screw the GL14 cap nut together with tube seal onto the device concerned (example shows VacuBox) or the Woulff bottle.
- Carefully insert the end of the tube (3) into the GL14 cap nut and tube seal.
- Tighten the GL14 cap nut and tube seal.
## Help with faults

</tbody>
</table>
8.2 Customer service

Repairs to the device may only be carried out by authorized service technicians. The service technicians have been comprehensively technically trained and are aware of the potential hazards that can arise from the device.

The addresses of the official BUCHI Customer Service offices can be found on the BUCHI website at: www.buchi.com. If you have any questions regarding technical issues or faults, please contact those offices.

Customer Services can offer you:

- supply of spare parts
- repairs
- technical advice
9 Taking out of service and disposal

9.1 Taking out of service
- Remove all tubing and communication cables from the device.
- Run the pump to dry out tubing and diaphragms inside the pump.
- Switch off the pump and disconnect it from the mains power supply.

9.2 Disposal
The operator is responsible for proper disposal of the \textit{Vacuum Pump}.
- When disposing of equipment observe the local regulations and statutory requirements regarding waste disposal.

10.3 Document: 11594022 ATEX

Instrument rating to ATEX II 3G T3 IIC X

BUCHI V-300 and V-600 vacuum pumps with the rating (see ATEX supplementary plate)

\[\text{Ex} \text{ II 3G T3 IIC X}\]

Internal atm. only
Doc.: 11594022 ATEX

The vacuum pump has an ATEX II 3G T3 IIC X rating according to the European Union ATEX Directive 214/34/EU. The rating applies exclusively to the area of the unit in contact with the fluid inside the vacuum pump. The pump is not suitable for operation in an environment with a potentially explosive atmosphere. Equipment in this category is intended for evacuation of areas in which it is unlikely that an explosive atmosphere created by gases, vapors, mist or swirling dust will occur. But if such an atmosphere does nevertheless occur, then in all probability it will happen only rarely and for a short period of time. The V-300 and V-600 are suitable for processing fluids in explosive class IIC and fluids with a flashpoint > 200°C.

The V-300 and V-600 vacuum pumps are subject to special requirements for compliance with the specified classification:

- Drawing in fluids with an intake pressure higher than atmospheric pressure is prohibited.
- Operation at ambient temperatures > 40°C is prohibited
- Drawing in fluids with a temperature > 40°C is prohibited
- The creation of sparks by foreign particles in the vacuum system must be prevented (as described in the Operating Instructions, Section 7 "Cleaning and maintenance")
- The creation of a flammable atmosphere by an unsealed vacuum system must be prevented (as described in the Operating Instructions, Section 7 "Cleaning and maintenance").

To prevent explosive mixtures forming inside the instrument, the use of gas ballast and/or venting valves is prohibited. The specified terminal vacuum (as per Operating Instructions, Section 3.5 "Technical data") of the pump must be achieved so that possible leaks can be excluded in order to prevent explosive mixtures forming inside the pump. Thus if performing work on the vacuum pump or sensor, the leakage rate must be checked.

NOTICE! The operating instructions must be fully read and understood before commissioning the V-300 or V-600 vacuum pump. The required measures must be taken.
10.4 Health and safety approval

To guarantee the health and safety of our staff and to comply with the law and the regulations for handling hazardous materials, for the purposes of health and safety at work and safe disposal of waste, no products may be sent back to BÜCHI Labortechnik AG or repaired unless we have received the declaration below, completed and signed.

Products sent to us will not be accepted for repair until we have received this declaration.

- Copy the form overleaf and complete it.
- Make sure that you know the full details of the substances with which the device has been in contact and that all questions have been answered fully and correctly.
- Send the completed form to us in advance by post or fax. The declaration must reach us before the device.
- Enclose a copy of the declaration with the device.
- If the product is contaminated, inform the carrier (in accordance with GGVE/GGVS/RID/ADR).

If the declaration is missing or the procedure described is not followed, the repairs will be delayed. We ask for your understanding and cooperation with regard to these measures.
10.5 Health and safety

Declaration regarding the safety, hazards and safe disposal of waste

To guarantee the health and safety of our staff and to comply with the law and the regulations for handling hazardous materials, regarding health and safety at work, and to comply with safety regulations, health and safety requirements and requirements for safe disposal of waste such as chemical waste, chemical residues or solvents, the form below must be fully completed and signed whenever devices or faulty components are to be sent back to our factory.

Products or components will not be accepted if this declaration has not been provided.

Device
Model: Part/Device no.:

Declaration for non-hazardous materials

We hereby assure that the products returned

☐ have not been used in the laboratory and are new.

☐ have not been in contact with toxic, corrosive, biologically active, explosive, radioactive or other hazardous materials.

☐ are not contaminated. The solvents or residues of the substances pumped have been removed.

Declaration for hazardous materials

In respect of the products returned, we hereby assure that

☐ all substances (toxic, corrosive, biologically active, explosive, radioactive or otherwise hazardous) that have been pumped by the products or have otherwise been in contact with the products are listed below.

☐ the products have been cleaned, decontaminated, sterilised inside and outside and all inlets and outlets are sealed.

List of hazardous materials that have been in contact with the products:

<table>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Final declaration

We hereby declare that

• we are fully conversant with the substances that have been in contact with the products and have answered all questions correctly.

• we have taken all measures necessary to prevent potential hazards in respect of the products returned.
