

Technical data sheet

UniversalExtractor E-800

The UniversalExtractor E-800 meets the highest expectations in applicational flexibility and safety standards for all extraction types. Thanks to its high performance heating system and the inert materials, there are no limitations regarding solvents. Using the glass assembly with the universal chamber, up to five different extraction methods can be run within the same set-up. As an alternative, the HE glass assembly is a rapid solution. The LSV configuration is designed for large sample volumes, allowing the lowest analyte detection levels.

Description of function

The UniversalExtractor E-800 is designed to carry out the following solid-liquid extraction methods:

- Hot Extraction (without chamber heater). See Chapter 1.1 “Hot Extraction (with Hot Extraction beaker)”, page 2
- Soxhlet Extraction (with and without chamber heater). See Chapter 1.2 “Soxhlet Extraction (with extraction glass chamber universal)”, page 3
- Continuous Extraction (with and without chamber heater). See Chapter 1.6 “Continuous Extraction (with extraction glass chamber universal)”, page 7
- Hot Extraction (with chamber heater). See Chapter 1.4 “Hot Extraction (with extraction glass chamber universal)”, page 5
- Soxhlet warm Extraction (with chamber heater). See Chapter 1.3 “Soxhlet Warm Extraction (with extraction glass chamber universal)”, page 4
- Twisselmann Extraction (with chamber heater). See Chapter 1.5 “Twisselmann Extraction (with extraction glass chamber universal)”, page 6

Hot Extraction (with Hot Extraction beaker)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The solvent is heated, vapor rises up to the condenser, condenses and drops into the beaker, containing the sample.

Step 2 rinsing

- The solvent in the beaker is heated and evaporated.
- The vapor rises up to the condenser.
- The condensed solvent flows into the beaker with the sample.
- The tank bottle valve opens periodically and condensed solvent flows in the tank bottle.
- The solvent level decreases.

Step 3 drying

- The solvent is heated, vapor rises up to the condenser, condenses and flows into tank.
- The analyte remains in the beaker.

Soxhlet Extraction (with extraction glass chamber universal)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is closed, the solvent is collected up to the level sensor and extracts the analyte.
- When the optical sensor is reached, the magnetic valve opens and the solvent containing the analyte flows back into the beaker.

Step 2 rinsing

- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is open, the solvent flows back into beaker, the solvent is not collected.

Step 3 drying

- The solvent is heated, vapor rises up to the condenser, condenses and flows into tank.
- The analyte remains in the beaker.

Soxhlet Warm Extraction (with extraction glass chamber universal)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The solvent in the extraction chamber is heated.
- The magnetic valve is closed, the solvent is collected up to the level sensor and extracts the analyte.
- When the optical sensor is reached, the magnetic valve opens and the solvent containing the analyte flows back into the beaker.

Step 2 rinsing

- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is open, the solvent flows back into beaker, the solvent is not collected.

Step 3 drying

- The solvent is heated, vapor rises up to the condenser, condenses and flows into tank.
- The analyte remains in the beaker.

Hot Extraction (with extraction glass chamber universal)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is closed, the solvent is collected up to the level sensor.
- The analyte is extracted.
- The solvent is heated in the extraction chamber, vapor rises up to the condenser, condenses and drops back into the extraction chamber.
- The magnetic valve opens regularly to release a small portion of extract into the beaker.

Step 2 rinsing

- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is open, the solvent flows back into beaker, the solvent is not collected.

Step 3 drying

- The solvent is heated, vapor rises up to the condenser, condenses and flows into tank.
- The analyte remains in the beaker.

Twisselmann Extraction (with extraction glass chamber universal)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The magnetic valve is closed, the solvent is collected in the extraction chamber. The solvent is heated, vapor rises up to the condenser, condenses, and drops back through the sample into the extraction chamber.

Step 2 rinsing

- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is open, the solvent flows back into beaker, the solvent is not collected.

Step 3 drying

- The solvent is heated, vapor rises up around the sample to the condenser, condenses and flows into the tank bottle.
- The analyte remains in the beaker.

Continuous Extraction (with extraction glass chamber universal)

Step 1 extraction

- The sample is located in the extraction chamber.
- The beaker contains the solvent.
- The solvent is heated, vapor rises up to the condenser, condenses and drops into the extraction chamber with the sample.
- The magnetic valve is open, the solvent extracts the analyte and flows back into the beaker.

Step 2 drying

- The solvent is heated, vapor rises up to the condenser, condenses and flows into the tank bottle.
- The analyte remains in the beaker.

Order code UniversalExtractor E-800

Using the glass assembly with the universal chamber, up to five different extraction methods can be run within the same set-up. The LSV configuration is designed for large sample volumes, allowing the lowest analyte detection levels.

As an alternative, the Hot glass assembly is a rapid solution.

The chamber heater allows for heating the solvent in the universal extraction chamber to increase the extraction efficiency. Needed for the extraction methods Soxhlet warm, Hot extraction (with extraction glass chamber universal) and Twisselmann. It cannot be combined with the Hot Extraction in beaker method. Options with inert gas are only delivered with chamber heater.

For environmentally friendly operation the UniversalExtractor E-800 can be bundled with Recirculating Chiller F-308/ F-314 for saving cooling water. The UniversalExtactor E-800 has to be operated either with a recirculating chiller or a tap water valve.

Technical data

UniversalExtractor E-800

Specification	UniversalExtractor E-800
Power consumption	1780 W
Connection voltage	200 - 240 ± 10 % VAC
Fuse	10 A
Frequency	50 / 60 Hz
Overvoltage category	II
Pollution degree	2

Specification	UniversalExtractor E-800
Dimensions (W x D x H) (without glassware)	638 x 595 x 613 mm
Dimensions (W x D x H) (with glassware Universal)	638 x 595 x 752 mm
Weight (without glassware)	44.8 kg
Weight (with glassware Universal)	52.6 kg
Total heating power (rated)	1680 W
Total Heating power (maximum)	1680 W
Hose connection	6 / 9 mm
Allowed water pressure (nominal value)	6 bar
Allowed water pressure (maximum)	8 bar
Minimum water flow	100 mL/min
Inlet cooling medium temperature	25 °C below the boiling point of the solvent
Number of extraction positions	6
Solvent tank volume	2 L
Allowed inert gas pressure (maximum)	3 bar
Max. filling level (Extraction glass chamber Universal)	190 mL
Max. filling level (Extraction glass chamber Universal LSV)	315 mL
Max. working volumes (Beaker Universal)	175 mL
Max. working volumes (Beaker LSV)	320 mL
Max. working volumes (Beaker Hot Extraction)	100 mL
Language	DE, EN, IT, ES, FR, JA, CN, PL, RU
Method storage	40 methods

Ambient conditions

For indoor use only.

Max. altitude above sea level	2000 m
Ambient temperature	5–40 °C
Maximum relative humidity	80% for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C
Storage temperature	max. 45 °C

Recirculating chiller

NOTE

Select a chiller according to your needs. See "A comprehensive guide to evaluate recirculating chillers for extraction units "
